

ABSTRACT

In a chip (215), an inlet (217), a main channel (221), a separation region (218), and dispensing channels (222) are formed on a substrate (216). It is structured such that a plurality of the dispensing channels (222) are communicated with the main channel (221), and detection reservoirs (223) are communicated with the respective dispensing channels (222).
